(54) Title: CLEANING IMPLEMENT

(57) Abrégé/Abstract:

Disclosed is a cleaning implement in the form of a sleeve-type self-wringing mop. In accordance with a preferred embodiment of the invention, the cleaning implement includes a shaft, a mop of a liquid absorbent material disposed at one end, and a wringer. The wringer includes a wringing sleeve that comprises a handle that is rotatably relative to the sleeve over at least a portion of the axial range of travel of the sleeve, and at least one volute. The volute has a generally helicoid surface that cooperates with a drive that is fixed with respect to the shaft, the volute and drive cooperating in the manner of a cam and cam follower. A user may advance the wringer upon grasping the handle and axially translating the handle relative to the shaft. The camming interaction between the volute and drive causes rotation of the wringing sleeve relative to the shaft to cause liquid to be expelled from the mop.
